Utilities for writers, photographers and software professionals

## **MenuFree™ - Screen Capture Pro will save you countless hours**

Do you frequently do screen captures for user documentation, to create Flash™ movies, or to illustrate image catalogs? Do you ever find it frustrating to navigate multiple menus, do captures over because of inaccurate cropping, or use a paint program to adjust the final captures?

It can take hours to do screen captures for large projects. This is frustrating when there are critical deadlines.

## **What is the value of your time?**

There are many screen capture programs. Some are free and others are priced as high as \$100. Most boast of features that have nothing to do with quickly doing accurate screen captures and all require menu navigation.

## **Screen Capture Pro's MenuFree™ user interface was designed to enhance productivity.**

Screen Capture Pro provides functionality not found in other screen capture programs – increasing productivity and saving time. In fact, when different features are needed there are no menus to navigate.

Screen Capture Pro is also the only screen capture program that does not require a mouse for region or area defined captures. People with difficulties using a mouse and users requiring “secure” pixel-by-pixel capture accuracy will love Screen Capture Pro's keyboard-only state.

## **Compare these Screen Capture Pro features with your current screen capture software:**

- Multiple capture modes are available when Screen Capture Pro is active and in the notification area of the status bar.
- Each capture mode has its own user-defined shortcut key.
- Region defined and adjustable fixed-size captures can be modified after a capture preview without starting the capture over.
- Region defined and adjustable fixed-size captures can be completed while keeping the capture mode active to allow multiple captures of the same screen with modifications on each capture.
- Change capture modes without opening the configuration dialog box or navigating any menus.
- Region defined, adjustable fixed-size captures, and window selected captures can be open (application-live state) while keeping windows functionality and applications active without starting captures over.
- Create region defined and adjustable fixed-size captures without using a mouse.
- Configure user-defined profiles that include the capture filename, directory where the capture is saved, and the image format.
- Change profiles after the capture is defined without starting over.
- Configure and modify any of the above settings without navigating a single menu.

If you are a technical writer, software professional, or anyone that requires screen captures, I challenge you to compare your current software with the Screen Capture Pro features.

## **If you regularly do screen captures you owe it to yourself to try Screen Capture Pro.**
